Writing Fast Code with Cython

Robert Bradshaw

SciPy 2008

◆□▶ ◆□▶ ▲三▶ ▲三▶ ▲□▶

Cython is...

- an Open Source project
- a Python compiler (almost)
- an extended Python language for
 - writing fast Python extension modules
 - interfacing Python with C (C++, etc.) libraries

▲□▶▲□▶▲三▶▲三▶ 三 のへで

• April 2002: release of Pyrex 0.1 by Greg Ewing

- Greg considers Pyrex a language in design phase
 - over the years, many people patched their Pyrex
 - not many patches were accepted by Greg
- minor forks and enhanced branches followed
 - March 2006: Stefan Behnel's fork of Pyrex for Ixml XML toolkit
 - November 2006: SageX fork of Pyrex
 - by Robert Bradshaw, William Stein (Univ. Washington)
 - context: Sage, a free mathematics software package
- 28th July 2007: official Cython launch
 - integration of Ixml's Pyrex fork into SageX
 - the rest is in http://hg.cython.org/cython-devel/

Cython generates very efficient C code

- according to PyBench
 - conditions and loops run 2-8x faster than in Py2.5
 - most benchmarks run 30%-80% faster
 - overall more than 30% faster for plain Python code
- optional type declarations
 - let Cython generate plain C instead of C-API calls
 - make code several times faster than the above (up to 100x)
- incremental optimization
 - optimize, don't re-write
 - only the pieces you need

- the Cython compiler reads in a .pxy file and produces a .c file
- a C compiler (such as gcc) produces a .so file
- the resulting module is linked against the CPython library, and loaded into the Python runtime environment

The details can be handled by distutils and/or pyximport.

foo.pyx

print "Welcome to SciPy 2008!"

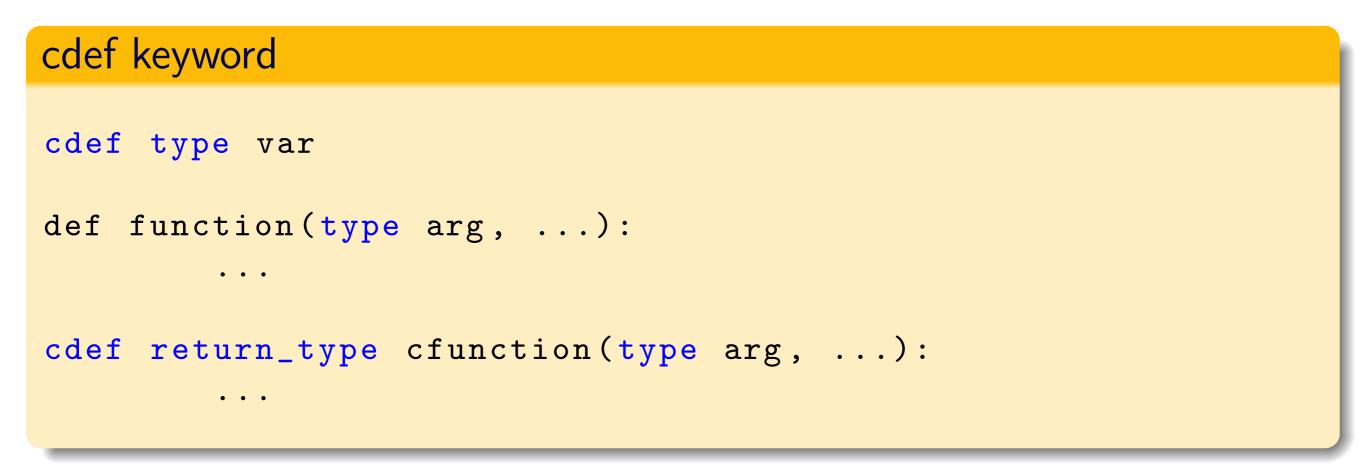

setup.py

```
from distutils.core import setup
from distutils.extension import Extension
from Cython.Distutils import build_ext
setup(
   cmdclass = {'build_ext': build_ext},
   ext_modules = [ Extension("foo", ["foo.pyx"]) ],
)
```

\$ python setup.py build_ext --inplace

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ▲□▶

The primary speedup in Cython comes from statically declaring types. This is done with the **cdef** keyword.

In the future one will be able to provide typing information via decorators.

Bradshaw ()

▲□▶▲□▶▲≡▶▲≡ ∽へ⊙

integrate.py

```
def f(x):
    return x*x*x - 3*x
def integrate_f(a, b, N):
    s = 0
    dx = (b-a)/N
    for i in range(N):
        s += f(a+i*dx)
    return s * dx
```

Goal: 100x speedup.

Bradshaw ()

SciPy 2008 8 / 25

◆□ ▶ ◆□ ▶ ▲ ■ ▶ ▲ □ ▶ ▲ □ ▶

integrate.pyx

```
cdef double f(double x):
    return x*x*x - 3*x
```

```
def integrate_f(double a, double b, int N):
    cdef double s = 0
    cdef double dx = (b-a)/N
    cdef int i
    for i in range(N):
        s += f(a+i*dx)
    return s * dx
```

External functions are declared in a cdef extern block

integrate.pyx

```
cdef extern from "math.h":
   double sin(double)
   double cos(double)
   ...
```

Modify your integration code to approximate $\int_a^b \frac{1}{\sqrt{1+x^2}}$.

▲□▶▲□▶▲□▶▲□▶ ■ 釣�?

Using external functions

You may have to modify your setup.py file as well.

setup.py

integrate.pyx

```
cdef extern from "mymath.h":
    double sinc(double)
```

Modify your integration code to approximate $\int_{a}^{b} \frac{\sin x}{x}$.

Bradshaw ()

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ < 三 りへ ()

SciPy 2008

11 / 25

Using external functions

One can put declarations in a .pxd file for reuse.

cmath.pxd

```
cdef extern from "math.h":
    double sin(double)
    double cos(double)
```

integrate.pyx

• • •

from cmath cimport *

Several .pxd files are provided in /Cython/Includes. Additions are welcome.

Bradshaw ()

- Python is fully memory managed, C is not.
- Cython is *both*.

stdlib.pxd

```
cdef extern from "stdlib.h":
    ctypedef unsigned long size_t
    void *malloc(size_t size)
    void *realloc(void *ptr, size_t size)
    void free(void *ptr)
```

Pointers and memory allocation

A list of ints is an int*.

fib.pyx

```
from stdlib cimport malloc, free

def fib(n):
    cdef int* mylist = <int*>malloc(sizeof(int) * n)
    mylist[0], mylist[1] = 1, 1
    for i in range(n):
        mylist[i] = mylist[i-1]+mylist[i-2]
    print mylist[n-1]
    free(mylist) # or you will never get it back
```

Note: The python list type turns out to be quite fast for objects.

- NumPy arrays are fast, efficient, and flexible.
- This summer Dag Seljebotn was funded by Google and Enthought to provide easy C access to NumPy arrays, and did an excellent job.
- Up to 1000x speedup over pure Python code

fastnumpy.pyx

```
cimport numpy
```

```
def sum(x):
    cdef numpy.ndarray[int, ndim=1] arr = x
    cdef int i, s = 0
    for i in range(arr.shape[0]):
        s += arr[i]
    return s
```

This loop gets translated into pure C.

NumPy and Buffers

heat.pyx

```
def solve_heat(initial_conditions, dx, dt, iter):
    cur = initial_conditions.copy()
    next = numpy.zeros_like(initial_conditions)
    M, N = cur.shape
    for count in range(iter):
        print count
        for i in range(1, M-1):
            for j in range(1, N-1):
               step = cur[i-1,j] + cur[i+1,j] + cur[i,j-1] +
                     next[i,j] = cur[i,j] + dt*step/dx^2
        cur, next = next, cur
    return cur
```

```
Goal: 1000x speedup.
```

Bradshaw ()

SciPy 2008 17 / 25

To speed things up even more, you can declare

- @cython.boundscheck(False)
- unsigned int indices

SciPy 2008

19 / 25

Extension classes can have

- c attributes (public/readonly/private)
- c methods (cdef and cpdef)

However, extension classes do not have

- dictionaries
- multiple inheritance

Take care with special methods

- some methods (e.g. arithmetic) work differently
- No __new__, but __cinit__ and __dealloc__

Bradshaw ()

Declaring Extension Classes

cclass.pyx

```
cdef class Foo(Bar):
    cdef int var
    def __init__(self, ...):
    def foo_py(self, ...):
         • • •
    cdef foo_c(self, ...):
        • • •
    cpdef foo_c_py(self, ...):
         . . .
```

Classes must be cimported to use C-level properties.

Bradshaw ()

One can declare structs, unions, enums, and typedefs just as in C.

foo.pyx
ctypedef long foo
<pre>cdef struct point: double x double y double z</pre>
<pre>cdef enum color: red orange yellow </pre>

・ロト < 団 > < 三 > < 三 > < □ > < □ >

Cython is not fully C++ aware (yet) but has the ability to wrap C++.

rect.h

```
class Rectangle {
public:
    int x0, y0, x1, y1;
    Rectangle(int x0, int y0, int x1, int y1);
    ~Rectangle();
    int getLength();
    int getHeight();
    int getArea();
    void move(int dx, int dy);
};
```

setup.py

lang="c++"

rectangle.pyx

```
cdef extern from "rect.h":
    ctypedef struct c_Rectangle "Rectangle":
        int x0, y0, x1, y1
        int getLength()
        int getHeight()
        int getArea()
        void move(int dx, int dy)
        c_Rectangle *new_Rectangle "new Rectangle" (int x0, int y0
        void del_Rectangle "delete" (c_Rectangle *rect)
```

Bradshaw ()
